To whom it may concern:

Compost Technologies produces all of our compost in accordance with the NOP standards for organic productions of compost which is; five turns within fifteen days at a temperature of at least 131 degrees F. Our C:N ratio begins between 25:1 and 40:1. The process takes between 8-12 weeks before curing. A random sample is taken biannually to test for heavy metals and pathogens (required by the State of Colorado) by Midwest Laboratories, Inc. These results and all time, temp, and turn records are available upon request.

The majority of the starting material is feedlot cow manure and barley straw, but may also contain sheep, horse, chicken, or local corral manure and canola, wheat, or rye straw. Saw dust is also used occasionally.

Thank you for your patronage and you can always contact me for questions and records. I can be reached at 719-588-8950, or 719-754-9092.
